# BATHROOM RADIATORS

Not only practical, a heated towel rail can transform your space into a warm, welcoming environment. Here is all you need to know before purchasing one

Words: **Yvette Murrell**

**T**asty towels are a real treat and something we now want at home as well as during hotel stays. Plumbed into your central heating or as a standalone electrical radiator, a range of designs, colours, and materials is now available to suit an array of schemes. Great for busy families, both towels and the room will dry quicker and many provide extra storage, too.

**Buying tips**

Always begin by determining what heat output – measured in British Thermal Units (BTUs) – you need. This will vary depending on the size of your room, how large windows and doors are, and the type of walls encasing it. A plumber will be able to calculate this for you – alternatively, many retailers offer online tools which can provide you with a guide number based on a few measurements. Also consider whether you want an electrical heater, which can be turned on and off as you please, or a plumbed-in one which will only operate at the same time as your central heating. There are also dual-fuel models, which are powered by a combination of both. In all cases, professional installation is recommended.

**Design decisions**

The look of your radiator will come down to the floor area available as well as your style. Wall-mounted or floor-standing heaters often have plenty of rails to hold towels, while a sleek modern one may need you to think about storage elsewhere – for example some shelving for your towels. Take into account the overall projection and any extras to ensure it will fit. Colours and finishes now also go beyond the classic shiny chrome to include bright hues or on-trend finishes such as brass and black.

**Need to know**

If your chosen design is plumbed into your central heating, you may need to buy valves, too, as these are not always sold together. There are different types – straight if the pipework rises out of the floor, or angled if it comes out of the wall. Speak to a plumber to find out which one you need. All electric heaters must have a minimum IP rating of IPX4 – which means they're protected against water splashes – and be at least 0.6m away from a bath or shower.

**Pricing**

Cost depends on the quality, heat output, and functionality your towel rail has. Expect to pay upwards of £200. **KBB**
